

### **SCREW FASTENERS CAN LOOSEN!**

Screw assemblies can loosen under the effect of vibration, impact and heat expansion.

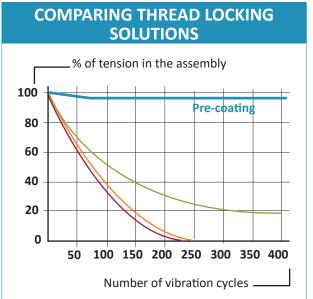

To secure assemblies that are screwed together and avoid any unforeseen loosening of screws and nuts, a variety of techniques have been developed: elastic washers, Nylon rings or patches, size interference, etc.

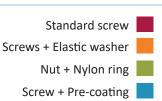

The most effective solution for stopping loosening is pre-coating to ensure thread locking:

This technique comprising pre-coating the threads with a dry thread locking compound that only becomes active during assembly.

## WHY USE PRE-COATED FASTENERS?

Pre-coated fasteners replace conventional thread locking solutions offering incomparable technical and financial results:

- Improved performance: unparalleled vibration resistance
- Facilitated design: replaces standard nuts and bolts with no need to redesign the assembly
- Fast assembly: no need for washers or adhesive
- Technical reliability: the amount of product deposited in the assembly is always the same
- Flawless quality: the thread locking process cannot be forgotten
- Significant assembly cost savings: high productivity in the shop or on-site
- Eliminates hygiene and safety issues linked to liquid adhesives

### **INNOVATION**

Thread locking using pre-coated fastener parts is achieved by factory coating parts with a thread locking compound, creating a dry patch on the screw or nut thread.

### TWO POSSIBLE SOLUTIONS:

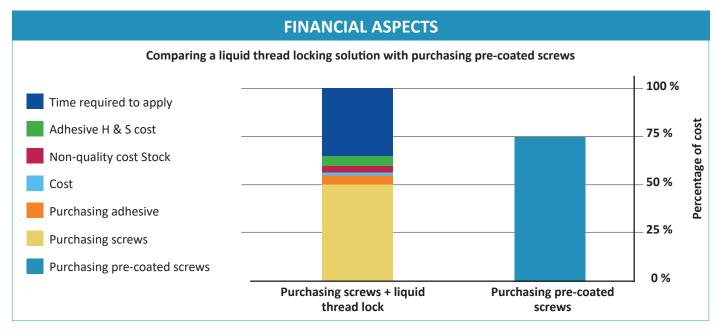

### THREAD LOCKING USING A MICRO-ENCAPSULATED ADHESIVE:

- This technique comprises pre-coating the threads with a microencapsulated adhesive that only becomes active during assembly.
- During assembly, the adhesive released by breaking the microcapsules polymerises and bonds the threaded parts together.
- This is the most efficient solution to stop slackening.

### REPOSITIONABLE POLYAMIDE THREAD LOCKING SOLUTION:

- When the parts are screwed down, the polyamide deposited on the threads is compressed. The radial tension caused by the elastic product deformation causes the locking action.
- The locked parts can be repositioned as the polyamide deformation is reversible allowing parts to be screwed down and released a number of times.
- The polyamide brings two additional functions compared with a bare screw:
  - 1. It dampens vibrations thereby avoiding unforeseen slackening.
  - 2. It avoids the loss of the screw should it become slack.
- The thread locking function is active immediately after screwing down.

## **PRODUCT TYPES**

The products deposited on the threaded part of the fasteners are of different types depending on requirements:

Locking with an adhesive	Brands	Products	Colours	Functions
	<b>3M</b>	3M 2353	Dark blue	High strength
		3M 2510	Orange	High strength + high temperature
	precote	Precote 30	Yellow	Low strength + sealing
		Precote 80	Green or Pink	High strength
		Precote 85	Turquoise	High strength
Repositionable locking	precote	Precote 10-1	Green	Low strength + repositionable
	NYLOK	Tuflok®	Dark blue	Low strength + repositionable

## **GENERAL PROPERTIES**

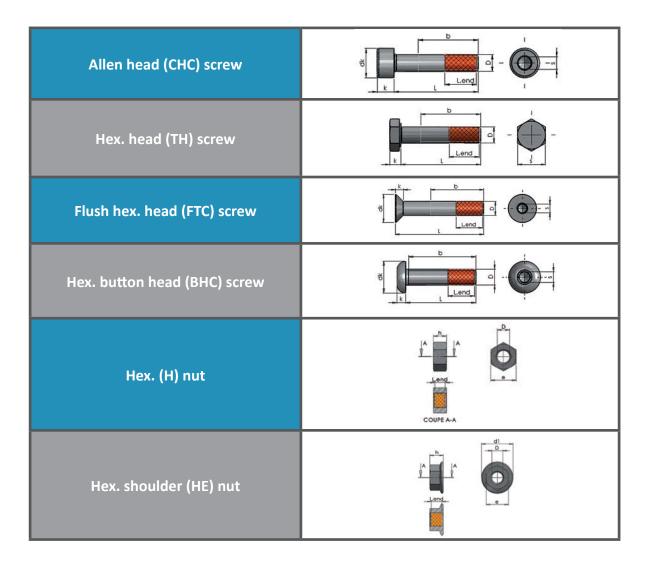

- Resistant to water and cooling liquids
- Resistant to gasoline and engine oils
- Resistant to refrigeration liquids
- Very resistant to vibration and impacts
- Ensures assembly sealing
- Protects from corrosion
- Can be disassembled using standard tools
- No deterioration of assembly parts

## **SOME EXAMPLES**

Uniquely in Europe, Soprima Industrie covers a wide range of needs for all professionals looking for handy and innovative fasteners.

# **QUALITY**

Our facilities are all ISO 9001 certified and our quality system fulfils the specific requirements of the automotive and aeronautical industries.
